

## ENTERPRISE LINK

The **Enterprise Link** allows you to connect valuable data available from your PanaCIM® Enterprise Edition MES with the other business systems in use at your factory. Export production data in a standardized format and in real time.

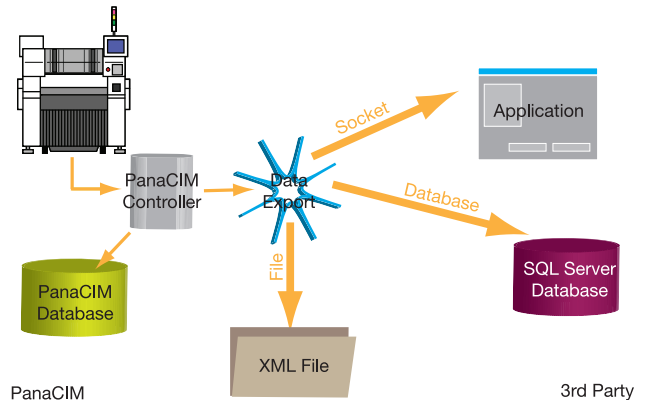

By seamlessly sharing data between these systems, the efficiency and productivity of your overall operation can be enhanced.

Enterprise Link can bridge manufacturing operations and the control level (i.e. MES) with 3rd party business planning systems such as MRP/ERP systems (SAP, Oracle, etc.).

The module exports in specific formats via several different real time interfaces including XML file, socket, and database.

### Examples of information that can be shared include:

- Traceability data to automatically update higher level traceability systems
- Component inventory or consumption data to update MRP with more accurate information
- Component loading information for tracking and inventory
- Production count and completion information to update planning and scheduling systems
- Material detail information downloads to PanaCIM for simplifying floor level scans
